This is *matrix-decomposition*, a library for decompose (factorize) dense and sparse matrices in Python.

There are several ways to obtain and install this package.

1.1 Conda

To install this package with *conda* run:

```
conda install -c jore matrix-decomposition
```

<https://anaconda.org/jore/matrix-decomposition>

1.2 pip

To install this package with *pip* run:

```
pip install 'matrix-decomposition'
```

<https://pypi.python.org/pypi/matrix-decomposition>

1.3 GitHub

To clone this package with *git* run:

```
git clone https://github.com/jor-/matrix-decomposition.git
```

To install this package after that with *python* run:

```
cd matrix-decomposition; python setup.py install
```

<https://github.com/jor-/matrix-decomposition>

CHAPTER 2

Documentation

<https://matrix-decomposition.readthedocs.io>

CHAPTER 3

Test status

4.1 Functions

Several functions are included in this package. The most important are summarized here.

4.1.1 decompose a matrix

`matrix.decompose(A, permutation=None, return_type=None, check_finite=True, overwrite_A=False)`

Computes a decomposition of a matrix.

Parameters

- **A** (*numpy.ndarray* or *scipy.sparse.spmatrix*) – Matrix to be decomposed. It is assumed, that A is Hermitian. The matrix must be a squared matrix.
- **permutation** (*str* or *numpy.ndarray*) – The symmetric permutation method that is applied to the matrix before it is decomposed. It has to be a value in *matrix.UNIVERSAL_PERMUTATION_METHODS*. If A is sparse, it can also be a value in *matrix.SPARSE_ONLY_PERMUTATION_METHODS*. It is also possible to directly pass a permutation vector. optional, default: no permutation
- **return_type** (*str*) – The type of the decomposition that should be calculated. It has to be a value in *matrix.DECOMPOSITION_TYPES*. If return_type is None the type of the returned decomposition is chosen by the function itself. optional, default: the type of the decomposition is chosen by the function itself
- **check_finite** (*bool*) – Whether to check that the input matrix contains only finite numbers. Disabling may result in problems (crashes, non-termination) if the inputs do contain infinities or NaNs. Disabling gives a performance gain. optional, default: True
- **overwrite_A** (*bool*) – Whether it is allowed to overwrite A. Enabling may result in performance gain. optional, default: False

Returns A decomposition of A of type *return_type*.

Return type *matrix.decompositions.DecompositionBase*

Raises

- *matrix.errors.NoDecompositionPossibleError* – If the decomposition of *A* is not possible.
- *matrix.errors.MatrixNotSquareError* – If *A* is not a square matrix.
- *matrix.errors.MatrixNotFiniteError* – If *A* is not a finite matrix and *check_finite* is True.

`matrix.UNIVERSAL_PERMUTATION_METHODS = ('none', 'decreasing_diagonal_values', 'increasing_`
Supported permutation methods for decompose dense and sparse matrices.

`matrix.SPARSE_ONLY_PERMUTATION_METHODS = ()`
Supported permutation methods only for sparse matrices.

`matrix.DECOMPOSITION_TYPES = ('LDL', 'LDL_compressed', 'LL')`
Supported types of decompositions.

4.1.2 approximate a matrix

`matrix.approximate.decomposition(A, min_diag_B=None, max_diag_B=None,`
`min_diag_D=None, max_diag_D=None,`
`min_abs_value_D=None, permutation=None, over-`
`write_A=False, return_type=None)`

Computes an approximative decomposition of a matrix with the specified properties.

Returns a decomposition of *A* if has such a decomposition and otherwise a decomposition of an approximation of *A*.

Parameters

- **A** (*numpy.ndarray* or *scipy.sparse.spmatrix*) – The matrix that should be approximated by a decomposition. It is assumed, that *A* is Hermitian. The matrix must be a squared matrix.
- **min_diag_B** (*numpy.ndarray* or *float*) – Each component of the diagonal of the composed matrix *B* of an approximated *LDL* decomposition is forced to be greater or equal to *min_diag_B*. optional, default : No minimal value is forced.
- **max_diag_B** (*numpy.ndarray* or *float*) – Each component of the diagonal of the composed matrix *B* of an approximated *LDL* decomposition is forced to be lower or equal to *max_diag_B*. optional, default : No maximal value is forced.
- **min_diag_D** (*float*) – Each component of the diagonal of the matrix *D* in an approximated *LDL* decomposition is forced to be greater or equal to *min_diag_D*. *min_diag_D* must be greater or equal to 0. optional, default : 0
- **max_diag_D** (*float*) – Each component of the diagonal of the matrix *D* in an approximated *LDL* decomposition is forced to be lower or equal to *max_diag_D*. optional, default : No maximal value is forced.
- **min_abs_value_D** (*float*) – Absolute values below *min_abs_value_D* are considered as zero in the matrix *D* of an approximated *LDL* decomposition. optional, default : `_matrix-`
The square root of the resolution of the underlying data type.
- **permutation** (*str* or *numpy.ndarray*) – The symmetric permutation method that is applied to the matrix before it is decomposed. It has to be a value in *matrix.APPROXIMATION_PERMUTATION_METHODS*. If *A* is sparse, it can also be a value in

`matrix.SPARSE_ONLY_PERMUTATION_METHODS`. It is also possible to directly pass a permutation vector. optional, default: The permutation is chosen by the algorithm.

- **overwrite_A** (*bool*) – Whether it is allowed to overwrite A. Enabling may result in performance gain. optional, default: False
- **return_type** (*str*) – The type of the decomposition that should be returned. It has to be a value in `matrix.DECOMPOSITION_TYPES`. optional, default : The type of the decomposition is chosen by the function itself.

Returns An (approximative) decomposition of A of type *return_type*.

Return type `matrix.decompositions.DecompositionBase`

Raises

- `matrix.errors.MatrixNotSquareError` – If A is not a square matrix.
- `matrix.errors.MatrixComplexDiagonalValueError` – If A has complex diagonal values.

```
matrix.approximate.positive_semidefinite_matrix(A, min_diag_B=None,
                                                max_diag_B=None,
                                                min_diag_D=None,
                                                max_diag_D=None,
                                                min_abs_value_D=None, permutation=None, overwrite_A=False)
```

Computes a positive semidefinite approximation of A.

Returns A if A is positive semidefinite and otherwise an approximation of A.

Parameters

- **A** (*numpy.ndarray* or *scipy.sparse.spmatrix*) – The matrix that should be approximated. It is assumed, that A is Hermitian. The matrix must be a squared matrix.
- **min_diag_B** (*numpy.ndarray* or *float*) – Each component of the diagonal of the returned matrix is forced to be greater or equal to *min_diag_B*. optional, default : No minimal value is forced.
- **max_diag_B** (*numpy.ndarray* or *float*) – Each component of the diagonal of the returned matrix is forced to be lower or equal to *max_diag_B*. optional, default : No maximal value is forced.
- **min_diag_D** (*float*) – Each component of the diagonal of the matrix *D* in a *LDL* decomposition of the returned matrix is forced to be greater or equal to *min_diag_D*. *min_diag_D* must be greater or equal to 0. optional, default : 0
- **max_diag_D** (*float*) – Each component of the diagonal of the matrix *D* in a *LDL* decomposition of the returned matrix is forced to be lower or equal to *max_diag_D*. optional, default : No maximal value is forced.
- **min_abs_value_D** (*float*) – Absolute values below *min_abs_value_D* are considered as zero in the matrix *D* in a *LDL* decomposition of the returned matrix. optional, default : `_matrix`The square root of the resolution of the underlying data type.
- **permutation** (*str* or *numpy.ndarray*) – The symmetric permutation method that is applied to the matrix before it is decomposed. It has to be a value in `matrix.APPROXIMATION_PERMUTATION_METHODS`. If A is sparse, it can also be a value in `matrix.SPARSE_ONLY_PERMUTATION_METHODS`. It is also possible to directly pass a permutation vector. optional, default: The permutation is chosen by the algorithm.

- **overwrite_A** (*bool*) – Whether it is allowed to overwrite A. Enabling may result in performance gain. optional, default: False

Returns B – An approximation of A which has a *LDL* decomposition.

Return type numpy.ndarray or scipy.sparse.spmatrix (same type as A)

Raises

- `matrix.errors.MatrixNotSquareError` – If A is not a square matrix.
- `matrix.errors.MatrixComplexDiagonalValueError` – If A has complex diagonal values.

```
matrix.approximate.positive_definite_matrix(A, min_diag_B=None, max_diag_B=None,  
                                              min_diag_D=None,    max_diag_D=None,  
                                              min_abs_value_D=None,      permuta-  
                                              tion=None, overwrite_A=False)
```

Computes a positive definite approximation of A.

Returns A if A is positive definite and otherwise an approximation of A.

Parameters

- **A** (*numpy.ndarray* or *scipy.sparse.spmatrix*) – The matrix that should be approximated. It is assumed, that A is Hermitian. The matrix must be a squared matrix.
- **min_diag_B** (*numpy.ndarray* or *float*) – Each component of the diagonal of the returned matrix is forced to be greater or equal to *min_diag_B*. optional, default : No minimal value is forced.
- **max_diag_B** (*numpy.ndarray* or *float*) – Each component of the diagonal of the returned matrix is forced to be lower or equal to *max_diag_B*. optional, default : No maximal value is forced.
- **min_diag_D** (*float*) – Each component of the diagonal of the matrix *D* in a *LDL* decomposition of the returned matrix is forced to be greater or equal to *min_diag_D*. *min_diag_D* must be greater than 0. optional, default : The square root of the resolution of the underlying data type.
- **max_diag_D** (*float*) – Each component of the diagonal of the matrix *D* in a *LDL* decomposition of the returned matrix is forced to be lower or equal to *max_diag_D*. optional, default : No maximal value is forced.
- **min_abs_value_D** (*float*) – Absolute values below *min_abs_value_D* are considered as zero in the matrix *D* in a *LDL* decomposition of the returned matrix. optional, default : `_matrix`The square root of the resolution of the underlying data type.
- **permutation** (*str* or *numpy.ndarray*) – The symmetric permutation method that is applied to the matrix before it is decomposed. It has to be a value in `matrix.APPROXIMATION_PERMUTATION_METHODS`. If A is sparse, it can also be a value in `matrix.SPARSE_ONLY_PERMUTATION_METHODS`. It is also possible to directly pass a permutation vector. optional, default: The permutation is chosen by the algorithm.
- **overwrite_A** (*bool*) – Whether it is allowed to overwrite A. Enabling may result in performance gain. optional, default: False

Returns B – An approximation of A which has a *LDL* decomposition.

Return type numpy.ndarray or scipy.sparse.spmatrix (same type as A)

Raises

- `matrix.errors.MatrixNotSquareError` – If A is not a square matrix.

- `matrix.errors.MatrixComplexDiagonalValueError` – If A has complex diagonal values.

`matrix.APPROXIMATION_PERMUTATION_METHODS = ('none', 'decreasing_diagonal_values', 'increasing_diagonal_values')`

Supported permutation methods for approximate dense and sparse matrices.

4.1.3 examine a matrix

`matrix.is_invertible(A, check_finite=True)`

Returns whether the passed matrix is an invertible matrix.

Parameters

- **A** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – The matrix that should be checked. It is assumed, that A is Hermitian. The matrix must be a squared matrix.
- **check_finite** (`bool`) – Whether to check that A contain only finite numbers. Disabling may result in problems (crashes, non-termination) if they contain infinities or NaNs. Disabling gives a performance gain. optional, default: True

Returns Whether A is invertible.

Return type `bool`

Raises `matrix.errors.MatrixNotFiniteError` – If A is not a finite matrix and `check_finite` is True.

`matrix.is_positive_semidefinite(A, check_finite=True)`

Returns whether the passed matrix is positive semi-definite.

Parameters

- **A** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – The matrix that should be checked. It is assumed, that A is Hermitian. The matrix must be a squared matrix.
- **check_finite** (`bool`) – Whether to check that A contain only finite numbers. Disabling may result in problems (crashes, non-termination) if they contain infinities or NaNs. Disabling gives a performance gain. optional, default: True

Returns Whether A is positive semi-definite.

Return type `bool`

Raises `matrix.errors.MatrixNotFiniteError` – If A is not a finite matrix and `check_finite` is True.

`matrix.is_positive_definite(A, check_finite=True)`

Returns whether the passed matrix is positive definite.

Parameters

- **A** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – The matrix that should be checked. It is assumed, that A is Hermitian. The matrix must be a squared matrix.
- **check_finite** (`bool`) – Whether to check that A contain only finite numbers. Disabling may result in problems (crashes, non-termination) if they contain infinities or NaNs. Disabling gives a performance gain. optional, default: True

Returns Whether A is positive definite.

Return type `bool`

Raises `matrix.errors.MatrixNotFiniteError` – If A is not a finite matrix and `check_finite` is True.

4.1.4 solve system of linear equations

`matrix.solve(A, b, overwrite_b=False, check_finite=True)`

Solves the equation $Ax = b$ regarding x .

Parameters

- **A** (*numpy.ndarray* or *scipy.sparse.spmatrix*) – The matrix that should be checked. It is assumed, that A is Hermitian. The matrix must be a squared matrix.
- **b** (*numpy.ndarray*) – Right-hand side vector or matrix in equation $Ax = b$. It must hold $b.shape[0] == A.shape[0]$.
- **overwrite_b** (*bool*) – Allow overwriting data in b . Enabling gives a performance gain. optional, default: False
- **check_finite** (*bool*) – Whether to check that A and b contain only finite numbers. Disabling may result in problems (crashes, non-termination) if they contain infinities or NaNs. Disabling gives a performance gain. optional, default: True

Returns An x so that $Ax = b$. The shape of x matches the shape of b .

Return type *numpy.ndarray*

Raises

- *matrix.errors.MatrixNotSquareError* – If A is not a square matrix.
- *matrix.errors.MatrixNotFiniteError* – If A is not a finite matrix and *check_finite* is True.
- *matrix.errors.MatrixSingularError* – If A is singular.

4.2 Matrix decompositions

Several matrix decompositions are supported. They are available in *matrix.decompositions*:

4.2.1 LL decomposition

class *matrix.decompositions.LLDecomposition* ($L=None, p=None$)

Bases: *matrix.decompositions.DecompositionBase*

A matrix decomposition where LL^H is the decomposed (permuted) matrix.

L is a lower triangle matrix with ones on the diagonal. This decomposition is also called Cholesky decomposition.

Parameters

- **L** (*numpy.ndarray* or *scipy.sparse.spmatrix*) – The matrix L of the decomposition. optional, If it is not set yet, it must be set later.
- **p** (*numpy.ndarray*) – The permutation vector used for the decomposition. This decomposition is of $A[p[:, np.newaxis], p[np.newaxis, :]]$ where A is a matrix. optional, default: no permutation

L

numpy.matrix or *scipy.sparse.spmatrix* – The matrix L of the decomposition.

P

`scipy.sparse.dok_matrix` – The permutation matrix. $P @ A @ P.T$ is the matrix A permuted by the permutation of the decomposition

as_LDL_Decomposition()

as_any_type (*type_strs, copy=False)

Convert decomposition to any of the passed types.

Parameters

- ***type_strs** (str) – The decomposition types to any of them this this decomposition is converted.
- **copy** (bool) – Whether the data of this decomposition should always be copied or only if needed.

Returns If the type of this decomposition is not in *type_strs*, a decomposition of type *type_str[0]* is returned which represents the same decomposed matrix as this decomposition. Otherwise this decomposition or a copy of it is returned, depending on *copy*.

Return type *matrix.decompositions.DecompositionBase*

as_type (type_str, copy=False)

Convert decomposition to passed type.

Parameters

- **type_str** (str) – The decomposition type to which this decomposition is converted.
- **copy** (bool) – Whether the data of this decomposition should always be copied or only if needed.

Returns If the type of this decomposition is not *type_str*, a decomposition of type *type_str* is returned which represents the same decomposed matrix as this decomposition. Otherwise this decomposition or a copy of it is returned, depending on *copy*.

Return type *matrix.decompositions.DecompositionBase*

check_finite (check_finite=True)

Check if this is a decomposition representing a finite matrix.

Parameters **check_finite** (bool) – Whether to perform this check. default: True

Raises *matrix.errors.DecompositionNotFiniteError* – If this is a decomposition representing a non-finite matrix.

check_invertible ()

Check if this is a decomposition representing an invertible matrix.

Raises *matrix.errors.DecompositionSingularError* – If this is a decomposition representing a singular matrix.

composed_matrix

`numpy.matrix` or `scipy.sparse.spmatrix` – The composed matrix represented by this decomposition.

copy ()

Copy this decomposition.

Returns A copy of this decomposition.

Return type *matrix.decompositions.DecompositionBase*

inverse_matrix_both_sides_multiplication (*x*, *y=None*)

Calculates the both sides (matrix-matrix or matrix-vector) product $y.H @ B @ x$, where B is the matrix inverse of the composed matrix represented by this decomposition.

Parameters

- **x** (*numpy.ndarray* or *scipy.sparse.spmatrix*) – Vector or matrix in the product $y.H @ B @ x$. It must hold `self.n == x.shape[0]`.
- **y** (*numpy.ndarray* or *scipy.sparse.spmatrix*) – Vector or matrix in the product $y.H @ B @ x$. It must hold `self.n == y.shape[0]`. optional, default: If *y* is not passed, *x* is used as *y*.

Returns The result of $x.H @ A @ y$.

Return type *numpy.ndarray* or *scipy.sparse.spmatrix*

Raises *matrix.errors.DecompositionSingularError* – If this is a decomposition representing a singular matrix.

inverse_matrix_right_side_multiplication (*x*)

Calculates the right side (matrix-matrix or matrix-vector) product $B @ x$, where B is the matrix inverse of the composed matrix represented by this decomposition.

Parameters **x** (*numpy.ndarray* or *scipy.sparse.spmatrix*) – Vector or matrix in the product in the matrix-matrix or matrix-vector $B @ x$. It must hold `self.n == x.shape[0]`.

Returns The result of $B @ x$.

Return type *numpy.ndarray* or *scipy.sparse.spmatrix*

Raises *matrix.errors.DecompositionSingularError* – If this is a decomposition representing a singular matrix.

is_almost_equal (*other*, *rtol=0.0001*, *atol=1e-06*)

Whether this decomposition is close to passed decomposition.

Parameters

- **other** (*str*) – The decomposition which to compare to this decomposition.
- **rtol** (*float*) – The relative tolerance parameter.
- **atol** (*float*) – The absolute tolerance parameter.

Returns Whether this decomposition is close to passed decomposition.

Return type *bool*

is_equal (*other*)

Whether this decomposition is equal to passed decomposition.

Parameters **other** (*str*) – The decomposition which to compare to this decomposition.

Returns Whether this decomposition is equal to passed decomposition.

Return type *bool*

is_finite ()

Returns whether this is a decomposition representing a finite matrix.

Returns Whether this is a decomposition representing a finite matrix.

Return type *bool*

is_invertible ()

Returns whether this is a decomposition representing an invertible matrix.

Returns Whether this is a decomposition representing an invertible matrix.

Return type `bool`

is_permuted

`bool` – Whether this is a decompositon with permutation.

is_positive_definite()

Returns whether this is a decomposition of a positive definite matrix.

Returns Whether this is a decomposition of a positive definite matrix.

Return type `bool`

is_positive_semidefinite()

Returns whether this is a decomposition of a positive semi-definite matrix.

Returns Whether this is a decomposition of a positive semi-definite matrix.

Return type `bool`

is_singular()

Returns whether this is a decomposition representing a singular matrix.

Returns Whether this is a decomposition representing a singular matrix.

Return type `bool`

is_sparse()

Returns whether this is a decomposition of a sparse matrix.

Returns Whether this is a decomposition of a sparse matrix.

Return type `bool`

is_type(type_str)

Whether this is a decomposition of the passed type.

Parameters `type_str (str)` – The decomposition type according to which is checked.

Returns Whether this is a decomposition of the passed type.

Return type `bool`

load(filename)

Loads a decomposition of this type.

Parameters `filename (str)` – Where the decomposition is saved.

Raises `FileNotFoundError` – If the files are not found in the passed directory.

matrix_both_sides_multiplication(x, y=None)

Calculates the both sides (matrix-matrix or matrix-vector) product $y.H @ A @ x$, where A is the composed matrix represented by this decomposition.

Parameters

- **x** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – Vector or matrix in the product $y.H @ A @ x$. It must hold `self.n == x.shape[0]`.
- **y** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – Vector or matrix in the product $y.H @ A @ x$. It must hold `self.n == y.shape[0]`. optional, default: If y is not passed, x is used as y.

Returns The result of $x.H @ A @ y$.

Return type `numpy.ndarray` or `scipy.sparse.spmatrix`

matrix_right_side_multiplication (*x*)

Calculates the right side (matrix-matrix or matrix-vector) product $A @ x$, where A is the composed matrix represented by this decomposition.

Parameters **x** (*numpy.ndarray* or *scipy.sparse.spmatrix*) – Vector or matrix in the product in the matrix-matrix or matrix-vector $A @ x$. It must hold `self.n == x.shape[0]`.

Returns The result of $A @ x$.

Return type *numpy.ndarray* or *scipy.sparse.spmatrix*

n

int – The dimension of the squared decomposed matrix.

p

numpy.ndarray – The permutation vector. $A[p[:, np.newaxis], p[np.newaxis, :]]$ is the matrix A permuted by the permutation of the decomposition

p_inverse

numpy.ndarray – The permutation vector that undos the permutation.

permute_matrix (*A*)

Permute a matrix by the permutation of the decomposition.

Parameters **A** (*numpy.ndarray* or *scipy.sparse.spmatrix*) – The matrix that should be permuted.

Returns The matrix A permuted by the permutation of the decomposition.

Return type *numpy.ndarray* or *scipy.sparse.spmatrix*

save (*filename*)

Saves this decomposition.

Parameters **filename** (*str*) – Where this decomposition should be saved.

solve (*b*)

Solves the equation $A x = b$ regarding x , where A is the composed matrix represented by this decomposition.

Parameters **b** (*numpy.ndarray* or *scipy.sparse.spmatrix*) – Right-hand side vector or matrix in equation $A x = b$. It must hold `self.n == b.shape[0]`.

Returns An x so that $A x = b$. The shape of x matches the shape of b .

Return type *numpy.ndarray* or *scipy.sparse.spmatrix*

Raises *matrix.errors.DecompositionSingularError* – If this is a decomposition representing a singular matrix.

type_str = 'LL'

str – The type of this decomposition represented as string.

unpermute_matrix (*A*)

Unpermute a matrix permuted by the permutation of the decomposition.

Parameters **A** (*numpy.ndarray* or *scipy.sparse.spmatrix*) – The matrix that should be unpermuted.

Returns The matrix A unpermuted by the permutation of the decomposition.

Return type *numpy.ndarray* or *scipy.sparse.spmatrix*

4.2.2 LDL decomposition

class `matrix.decompositions.LDL_Decomposition` ($L=None$, $d=None$, $p=None$)

Bases: `matrix.decompositions.DecompositionBase`

A matrix decomposition where LDL^H is the decomposed (permuted) matrix.

L is a lower triangle matrix with ones on the diagonal. D is a diagonal matrix. Only the diagonal values of D are stored.

Parameters

- **L** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – The matrix L of the decomposition. optional, If it is not set yet, it must be set later.
- **d** (`numpy.ndarray`) – The vector of the diagonal components of D of the decomposition. optional, If it is not set yet, it must be set later.
- **p** (`numpy.ndarray`) – The permutation vector used for the decomposition. This decomposition is of $A[p[:, np.newaxis], p[np.newaxis, :]]$ where A is a matrix. optional, default: no permutation

D

`scipy.sparse.dia_matrix` – The permutation matrix.

L

`numpy.matrix` or `scipy.sparse.spmatrix` – The matrix L of the decomposition.

LD

`numpy.matrix` or `scipy.sparse.spmatrix` – A matrix whose diagonal values are the diagonal values of D and whose off-diagonal values are those of L .

P

`scipy.sparse.dok_matrix` – The permutation matrix. $P @ A @ P.T$ is the matrix A permuted by the permutation of the decomposition

as_LDL_DecompositionCompressed()

as_LL_Decomposition()

as_any_type (**type_strs*, *copy=False*)

Convert decomposition to any of the passed types.

Parameters

- ***type_strs** (*str*) – The decomposition types to any of them this this decomposition is converted.
- **copy** (*bool*) – Whether the data of this decomposition should always be copied or only if needed.

Returns If the type of this decomposition is not in *type_strs*, a decomposition of type *type_str[0]* is returned which represents the same decomposed matrix as this decomposition. Otherwise this decomposition or a copy of it is returned, depending on *copy*.

Return type `matrix.decompositions.DecompositionBase`

as_type (*type_str*, *copy=False*)

Convert decomposition to passed type.

Parameters

- **type_str** (*str*) – The decomposition type to which this decomposition is converted.

- **copy** (*bool*) – Whether the data of this decomposition should always be copied or only if needed.

Returns If the type of this decomposition is not *type_str*, a decomposition of type *type_str* is returned which represents the same decomposed matrix as this decomposition. Otherwise this decomposition or a copy of it is returned, depending on *copy*.

Return type *matrix.decompositions.DecompositionBase*

check_finite (*check_finite=True*)

Check if this is a decomposition representing a finite matrix.

Parameters **check_finite** (*bool*) – Whether to perform this check. default: True

Raises *matrix.errors.DecompositionNotFiniteError* – If this is a decomposition representing a non-finite matrix.

check_invertible ()

Check if this is a decomposition representing an invertible matrix.

Raises *matrix.errors.DecompositionSingularError* – If this is a decomposition representing a singular matrix.

composed_matrix

numpy.matrix or *scipy.sparse.spmatrix* – The composed matrix represented by this decomposition.

copy ()

Copy this decomposition.

Returns A copy of this decomposition.

Return type *matrix.decompositions.DecompositionBase*

d

numpy.ndarray – The diagonal vector of the matrix *D* of the decomposition.

inverse_matrix_both_sides_multiplication (*x, y=None*)

Calculates the both sides (matrix-matrix or matrix-vector) product $y.H @ B @ x$, where *B* is the matrix inverse of the composed matrix represented by this decomposition.

Parameters

- **x** (*numpy.ndarray* or *scipy.sparse.spmatrix*) – Vector or matrix in the product $y.H @ B @ x$. It must hold *self.n == x.shape[0]*.
- **y** (*numpy.ndarray* or *scipy.sparse.spmatrix*) – Vector or matrix in the product $y.H @ B @ x$. It must hold *self.n == y.shape[0]*. optional, default: If y is not passed, x is used as y.

Returns The result of $x.H @ A @ y$.

Return type *numpy.ndarray* or *scipy.sparse.spmatrix*

Raises *matrix.errors.DecompositionSingularError* – If this is a decomposition representing a singular matrix.

inverse_matrix_right_side_multiplication (*x*)

Calculates the right side (matrix-matrix or matrix-vector) product $B @ x$, where *B* is the matrix inverse of the composed matrix represented by this decomposition.

Parameters **x** (*numpy.ndarray* or *scipy.sparse.spmatrix*) – Vector or matrix in the product in the matrix-matrix or matrix-vector $B @ x$. It must hold *self.n == x.shape[0]*.

Returns The result of $B @ x$.

Return type `numpy.ndarray` or `scipy.sparse.spmatrix`

Raises `matrix.errors.DecompositionSingularError` – If this is a decomposition representing a singular matrix.

`is_almost_equal` (*other*, *rtol*=0.0001, *atol*=1e-06)

Whether this decomposition is close to passed decomposition.

Parameters

- **`other`** (*str*) – The decomposition which to compare to this decomposition.
- **`rtol`** (*float*) – The relative tolerance parameter.
- **`atol`** (*float*) – The absolute tolerance parameter.

Returns Whether this decomposition is close to passed decomposition.

Return type `bool`

`is_equal` (*other*)

Whether this decomposition is equal to passed decomposition.

Parameters **`other`** (*str*) – The decomposition which to compare to this decomposition.

Returns Whether this decomposition is equal to passed decomposition.

Return type `bool`

`is_finite` ()

Returns whether this is a decomposition representing a finite matrix.

Returns Whether this is a decomposition representing a finite matrix.

Return type `bool`

`is_invertible` ()

Returns whether this is a decomposition representing an invertible matrix.

Returns Whether this is a decomposition representing an invertible matrix.

Return type `bool`

`is_permuted`

`bool` – Whether this is a decompositon with permutation.

`is_positive_definite` ()

Returns whether this is a decomposition of a positive definite matrix.

Returns Whether this is a decomposition of a positive definite matrix.

Return type `bool`

`is_positive_semidefinite` ()

Returns whether this is a decomposition of a positive semi-definite matrix.

Returns Whether this is a decomposition of a positive semi-definite matrix.

Return type `bool`

`is_singular` ()

Returns whether this is a decomposition representing a singular matrix.

Returns Whether this is a decomposition representing a singular matrix.

Return type `bool`

is_sparse()

Returns whether this is a decomposition of a sparse matrix.

Returns Whether this is a decomposition of a sparse matrix.

Return type `bool`

is_type(*type_str*)

Whether this is a decomposition of the passed type.

Parameters **type_str** (*str*) – The decomposition type according to which is checked.

Returns Whether this is a decomposition of the passed type.

Return type `bool`

load(*filename*)

Loads a decomposition of this type.

Parameters **filename** (*str*) – Where the decomposition is saved.

Raises `FileNotFoundError` – If the files are not found in the passed directory.

matrix_both_sides_multiplication(*x*, *y=None*)

Calculates the both sides (matrix-matrix or matrix-vector) product $y.H @ A @ x$, where A is the composed matrix represented by this decomposition.

Parameters

- **x** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – Vector or matrix in the product $y.H @ A @ x$. It must hold `self.n == x.shape[0]`.
- **y** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – Vector or matrix in the product $y.H @ A @ x$. It must hold `self.n == y.shape[0]`. optional, default: If y is not passed, x is used as y .

Returns The result of $x.H @ A @ y$.

Return type `numpy.ndarray` or `scipy.sparse.spmatrix`

matrix_right_side_multiplication(*x*)

Calculates the right side (matrix-matrix or matrix-vector) product $A @ x$, where A is the composed matrix represented by this decomposition.

Parameters **x** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – Vector or matrix in the product in the matrix-matrix or matrix-vector $A @ x$. It must hold `self.n == x.shape[0]`.

Returns The result of $A @ x$.

Return type `numpy.ndarray` or `scipy.sparse.spmatrix`

n

`int` – The dimension of the squared decomposed matrix.

p

`numpy.ndarray` – The permutation vector. $A[p[:, np.newaxis], p[np.newaxis, :]]$ is the matrix A permuted by the permutation of the decomposition

p_inverse

`numpy.ndarray` – The permutation vector that undos the permutation.

permute_matrix(*A*)

Permute a matrix by the permutation of the decomposition.

Parameters **A** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – The matrix that should be permuted.

Returns The matrix A permuted by the permutation of the decomposition.

Return type `numpy.ndarray` or `scipy.sparse.spmatrix`

save (*filename*)

Saves this decomposition.

Parameters **filename** (*str*) – Where this decomposition should be saved.

solve (*b*)

Solves the equation $Ax = b$ regarding x , where A is the composed matrix represented by this decomposition.

Parameters **b** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – Right-hand side vector or matrix in equation $Ax = b$. It must hold `self.n == b.shape[0]`.

Returns An x so that $Ax = b$. The shape of x matches the shape of b .

Return type `numpy.ndarray` or `scipy.sparse.spmatrix`

Raises `matrix.errors.DecompositionSingularError` – If this is a decomposition representing a singular matrix.

type_str = 'LDL'

str – The type of this decomposition represented as string.

unpermute_matrix (*A*)

Unpermute a matrix permuted by the permutation of the decomposition.

Parameters **A** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – The matrix that should be unpermuted.

Returns The matrix A unpermuted by the permutation of the decomposition.

Return type `numpy.ndarray` or `scipy.sparse.spmatrix`

4.2.3 LDL decomposition compressed

class `matrix.decompositions.LDL_DecompositionCompressed` (*LD=None, p=None*)

Bases: `matrix.decompositions.DecompositionBase`

A matrix decomposition where LDL^H is the decomposed (permuted) matrix.

L is a lower triangle matrix with ones on the diagonal. D is a diagonal matrix. L and D are stored in one matrix whose diagonal values are the diagonal values of D and whose off-diagonal values are those of L .

Parameters

- **LD** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – A matrix whose diagonal values are the diagonal values of D and whose off-diagonal values are those of L . optional, If it is not set yet, it must be set later.
- **p** (`numpy.ndarray`) – The permutation vector used for the decomposition. This decomposition is of $A[p[:, np.newaxis], p[np.newaxis, :]]$ where A is a matrix. optional, default: no permutation

D

`scipy.sparse.dia_matrix` – The permutation matrix.

L

`numpy.matrix` or `scipy.sparse.spmatrix` – The matrix L of the decomposition.

LD

`numpy.matrix` or `scipy.sparse.spmatrix` – A matrix whose diagonal values are the diagonal values of D and whose off-diagonal values are those of L .

P

`scipy.sparse.dok_matrix` – The permutation matrix. $P @ A @ P.T$ is the matrix A permuted by the permutation of the decomposition

as_LDL_Decomposition()

as_any_type (*type_strs, copy=False)

Convert decomposition to any of the passed types.

Parameters

- ***type_strs** (*str*) – The decomposition types to any of them this this decomposition is converted.
- **copy** (*bool*) – Whether the data of this decomposition should always be copied or only if needed.

Returns If the type of this decomposition is not in *type_strs*, a decomposition of type *type_str[0]* is returned which represents the same decomposed matrix as this decomposition. Otherwise this decomposition or a copy of it is returned, depending on *copy*.

Return type *matrix.decompositions.DecompositionBase*

as_type (type_str, copy=False)

Convert decomposition to passed type.

Parameters

- **type_str** (*str*) – The decomposition type to which this decomposition is converted.
- **copy** (*bool*) – Whether the data of this decomposition should always be copied or only if needed.

Returns If the type of this decomposition is not *type_str*, a decomposition of type *type_str* is returned which represents the same decomposed matrix as this decomposition. Otherwise this decomposition or a copy of it is returned, depending on *copy*.

Return type *matrix.decompositions.DecompositionBase*

check_finite (check_finite=True)

Check if this is a decomposition representing a finite matrix.

Parameters **check_finite** (*bool*) – Whether to perform this check. default: True

Raises *matrix.errors.DecompositionNotFiniteError* – If this is a decomposition representing a non-finite matrix.

check_invertible ()

Check if this is a decomposition representing an invertible matrix.

Raises *matrix.errors.DecompositionSingularError* – If this is a decomposition representing a singular matrix.

composed_matrix

`numpy.matrix` or `scipy.sparse.spmatrix` – The composed matrix represented by this decomposition.

copy ()

Copy this decomposition.

Returns A copy of this decomposition.

Return type `matrix.decompositions.DecompositionBase`

d

`numpy.ndarray` – The diagonal vector of the matrix D of the decomposition.

inverse_matrix_both_sides_multiplication ($x, y=None$)

Calculates the both sides (matrix-matrix or matrix-vector) product $y.H @ B @ x$, where B is the matrix inverse of the composed matrix represented by this decomposition.

Parameters

- **x** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – Vector or matrix in the product $y.H @ B @ x$. It must hold `self.n == x.shape[0]`.
- **y** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – Vector or matrix in the product $y.H @ B @ x$. It must hold `self.n == y.shape[0]`. optional, default: If y is not passed, x is used as y .

Returns The result of $x.H @ A @ y$.

Return type `numpy.ndarray` or `scipy.sparse.spmatrix`

Raises `matrix.errors.DecompositionSingularError` – If this is a decomposition representing a singular matrix.

inverse_matrix_right_side_multiplication (x)

Calculates the right side (matrix-matrix or matrix-vector) product $B @ x$, where B is the matrix inverse of the composed matrix represented by this decomposition.

Parameters **x** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – Vector or matrix in the product in the matrix-matrix or matrix-vector $B @ x$. It must hold `self.n == x.shape[0]`.

Returns The result of $B @ x$.

Return type `numpy.ndarray` or `scipy.sparse.spmatrix`

Raises `matrix.errors.DecompositionSingularError` – If this is a decomposition representing a singular matrix.

is_almost_equal ($other, rtol=0.0001, atol=1e-06$)

Whether this decomposition is close to passed decomposition.

Parameters

- **other** (`str`) – The decomposition which to compare to this decomposition.
- **rtol** (`float`) – The relative tolerance parameter.
- **atol** (`float`) – The absolute tolerance parameter.

Returns Whether this decomposition is close to passed decomposition.

Return type `bool`

is_equal ($other$)

Whether this decomposition is equal to passed decomposition.

Parameters **other** (`str`) – The decomposition which to compare to this decomposition.

Returns Whether this decomposition is equal to passed decomposition.

Return type `bool`

is_finite ()

Returns whether this is a decomposition representing a finite matrix.

Returns Whether this is a decomposition representing a finite matrix.

Return type `bool`

is_invertible()

Returns whether this is a decomposition representing an invertible matrix.

Returns Whether this is a decomposition representing an invertible matrix.

Return type `bool`

is_permuted

`bool` – Whether this is a decompositon with permutation.

is_positive_definite()

Returns whether this is a decomposition of a positive definite matrix.

Returns Whether this is a decomposition of a positive definite matrix.

Return type `bool`

is_positive_semidefinite()

Returns whether this is a decomposition of a positive semi-definite matrix.

Returns Whether this is a decomposition of a positive semi-definite matrix.

Return type `bool`

is_singular()

Returns whether this is a decomposition representing a singular matrix.

Returns Whether this is a decomposition representing a singular matrix.

Return type `bool`

is_sparse()

Returns whether this is a decomposition of a sparse matrix.

Returns Whether this is a decomposition of a sparse matrix.

Return type `bool`

is_type(*type_str*)

Whether this is a decomposition of the passed type.

Parameters `type_str` (*str*) – The decomposition type according to which is checked.

Returns Whether this is a decomposition of the passed type.

Return type `bool`

load(*filename*)

Loads a decomposition of this type.

Parameters `filename` (*str*) – Where the decomposition is saved.

Raises `FileNotFoundError` – If the files are not found in the passed directory.

matrix_both_sides_multiplication(*x*, *y=None*)

Calculates the both sides (matrix-matrix or matrix-vector) product $y.H @ A @ x$, where A is the composed matrix represented by this decomposition.

Parameters

- `x` (`numpy.ndarray` or `scipy.sparse.spmatrix`) – Vector or matrix in the product $y.H @ A @ x$. It must hold `self.n == x.shape[0]`.

- **y** (*numpy.ndarray* or *scipy.sparse.spmatrix*) – Vector or matrix in the product $y.H @ A @ x$. It must hold $self.n == y.shape[0]$. optional, default: If y is not passed, x is used as y.

Returns The result of $x.H @ A @ y$.

Return type *numpy.ndarray* or *scipy.sparse.spmatrix*

matrix_right_side_multiplication (*x*)

Calculates the right side (matrix-matrix or matrix-vector) product $A @ x$, where A is the composed matrix represented by this decomposition.

Parameters **x** (*numpy.ndarray* or *scipy.sparse.spmatrix*) – Vector or matrix in the product in the matrix-matrix or matrix-vector $A @ x$. It must hold $self.n == x.shape[0]$.

Returns The result of $A @ x$.

Return type *numpy.ndarray* or *scipy.sparse.spmatrix*

n

int – The dimension of the squared decomposed matrix.

p

numpy.ndarray – The permutation vector. $A[p[:, np.newaxis], p[np.newaxis, :]]$ is the matrix A permuted by the permutation of the decomposition

p_inverse

numpy.ndarray – The permutation vector that undoes the permutation.

permute_matrix (A)

Permute a matrix by the permutation of the decomposition.

Parameters **A** (*numpy.ndarray* or *scipy.sparse.spmatrix*) – The matrix that should be permuted.

Returns The matrix A permuted by the permutation of the decomposition.

Return type *numpy.ndarray* or *scipy.sparse.spmatrix*

save (*filename*)

Saves this decomposition.

Parameters **filename** (*str*) – Where this decomposition should be saved.

solve (*b*)

Solves the equation $A x = b$ regarding x , where A is the composed matrix represented by this decomposition.

Parameters **b** (*numpy.ndarray* or *scipy.sparse.spmatrix*) – Right-hand side vector or matrix in equation $A x = b$. It must hold $self.n == b.shape[0]$.

Returns An x so that $A x = b$. The shape of x matches the shape of b .

Return type *numpy.ndarray* or *scipy.sparse.spmatrix*

Raises *matrix.errors.DecompositionSingularError* – If this is a decomposition representing a singular matrix.

type_str = 'LDL_compressed'

str – The type of this decomposition represented as string.

unpermute_matrix (A)

Unpermute a matrix permuted by the permutation of the decomposition.

Parameters **A** (*numpy.ndarray* or *scipy.sparse.spmatrix*) – The matrix that should be unpermuted.

Returns The matrix *A* unpermuted by the permutation of the decomposition.

Return type *numpy.ndarray* or *scipy.sparse.spmatrix*

4.2.4 base decomposition

class `matrix.decompositions.DecompositionBase` (*p=None*)

Bases: *object*

A matrix decomposition.

This class is a base class for matrix decompositions.

Parameters **p** (*numpy.ndarray*) – The permutation vector used for the decomposition. This decomposition is of $A[p[:, \text{np.newaxis}], p[\text{np.newaxis}, :]]$ where *A* is a matrix. optional, default: no permutation

P

scipy.sparse.dok_matrix – The permutation matrix. $P @ A @ P.T$ is the matrix *A* permuted by the permutation of the decomposition

as_any_type (**type_strs, copy=False*)

Convert decomposition to any of the passed types.

Parameters

- ***type_strs** (*str*) – The decomposition types to any of them this this decomposition is converted.
- **copy** (*bool*) – Whether the data of this decomposition should always be copied or only if needed.

Returns If the type of this decomposition is not in *type_strs*, a decomposition of type *type_str[0]* is returned which represents the same decomposed matrix as this decomposition. Otherwise this decomposition or a copy of it is returned, depending on *copy*.

Return type *matrix.decompositions.DecompositionBase*

as_type (*type_str, copy=False*)

Convert decomposition to passed type.

Parameters

- **type_str** (*str*) – The decomposition type to which this decomposition is converted.
- **copy** (*bool*) – Whether the data of this decomposition should always be copied or only if needed.

Returns If the type of this decomposition is not *type_str*, a decomposition of type *type_str* is returned which represents the same decomposed matrix as this decomposition. Otherwise this decomposition or a copy of it is returned, depending on *copy*.

Return type *matrix.decompositions.DecompositionBase*

check_finite (*check_finite=True*)

Check if this is a decomposition representing a finite matrix.

Parameters **check_finite** (*bool*) – Whether to perform this check. default: True

Raises *matrix.errors.DecompositionNotFiniteError* – If this is a decomposition representing a non-finite matrix.

check_invertible()

Check if this is a decomposition representing an invertible matrix.

Raises `matrix.errors.DecompositionSingularError` – If this is a decomposition representing a singular matrix.

composed_matrix

`numpy.matrix` or `scipy.sparse.spmatrix` – The composed matrix represented by this decomposition.

copy()

Copy this decomposition.

Returns A copy of this decomposition.

Return type `matrix.decompositions.DecompositionBase`

inverse_matrix_both_sides_multiplication(*x*, *y=None*)

Calculates the both sides (matrix-matrix or matrix-vector) product $y.H @ B @ x$, where B is the matrix inverse of the composed matrix represented by this decomposition.

Parameters

- **x** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – Vector or matrix in the product $y.H @ B @ x$. It must hold `self.n == x.shape[0]`.
- **y** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – Vector or matrix in the product $y.H @ B @ x$. It must hold `self.n == y.shape[0]`. optional, default: If *y* is not passed, *x* is used as *y*.

Returns The result of $x.H @ A @ y$.

Return type `numpy.ndarray` or `scipy.sparse.spmatrix`

Raises `matrix.errors.DecompositionSingularError` – If this is a decomposition representing a singular matrix.

inverse_matrix_right_side_multiplication(*x*)

Calculates the right side (matrix-matrix or matrix-vector) product $B @ x$, where B is the matrix inverse of the composed matrix represented by this decomposition.

Parameters **x** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – Vector or matrix in the product in the matrix-matrix or matrix-vector $B @ x$. It must hold `self.n == x.shape[0]`.

Returns The result of $B @ x$.

Return type `numpy.ndarray` or `scipy.sparse.spmatrix`

Raises `matrix.errors.DecompositionSingularError` – If this is a decomposition representing a singular matrix.

is_almost_equal(*other*, *rtol=0.0001*, *atol=1e-06*)

Whether this decomposition is close to passed decomposition.

Parameters

- **other** (`str`) – The decomposition which to compare to this decomposition.
- **rtol** (`float`) – The relative tolerance parameter.
- **atol** (`float`) – The absolute tolerance parameter.

Returns Whether this decomposition is close to passed decomposition.

Return type `bool`

is_equal (*other*)

Whether this decomposition is equal to passed decomposition.

Parameters **other** (*str*) – The decomposition which to compare to this decomposition.

Returns Whether this decomposition is equal to passed decomposition.

Return type `bool`

is_finite ()

Returns whether this is a decomposition representing a finite matrix.

Returns Whether this is a decomposition representing a finite matrix.

Return type `bool`

is_invertible ()

Returns whether this is a decomposition representing an invertible matrix.

Returns Whether this is a decomposition representing an invertible matrix.

Return type `bool`

is_permuted

`bool` – Whether this is a decompositon with permutation.

is_positive_definite ()

Returns whether this is a decomposition of a positive definite matrix.

Returns Whether this is a decomposition of a positive definite matrix.

Return type `bool`

is_positive_semidefinite ()

Returns whether this is a decomposition of a positive semi-definite matrix.

Returns Whether this is a decomposition of a positive semi-definite matrix.

Return type `bool`

is_singular ()

Returns whether this is a decomposition representing a singular matrix.

Returns Whether this is a decomposition representing a singular matrix.

Return type `bool`

is_sparse ()

Returns whether this is a decomposition of a sparse matrix.

Returns Whether this is a decomposition of a sparse matrix.

Return type `bool`

is_type (*type_str*)

Whether this is a decomposition of the passed type.

Parameters **type_str** (*str*) – The decomposition type according to which is checked.

Returns Whether this is a decomposition of the passed type.

Return type `bool`

load (*filename*)

Loads a decomposition of this type.

Parameters **filename** (*str*) – Where the decomposition is saved.

Raises `FileNotFoundError` – If the files are not found in the passed directory.

matrix_both_sides_multiplication (*x*, *y=None*)

Calculates the both sides (matrix-matrix or matrix-vector) product $y.H @ A @ x$, where A is the composed matrix represented by this decomposition.

Parameters

- **x** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – Vector or matrix in the product $y.H @ A @ x$. It must hold `self.n == x.shape[0]`.
- **y** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – Vector or matrix in the product $y.H @ A @ x$. It must hold `self.n == y.shape[0]`. optional, default: If *y* is not passed, *x* is used as *y*.

Returns The result of $x.H @ A @ y$.

Return type `numpy.ndarray` or `scipy.sparse.spmatrix`

matrix_right_side_multiplication (*x*)

Calculates the right side (matrix-matrix or matrix-vector) product $A @ x$, where A is the composed matrix represented by this decomposition.

Parameters **x** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – Vector or matrix in the product in the matrix-matrix or matrix-vector $A @ x$. It must hold `self.n == x.shape[0]`.

Returns The result of $A @ x$.

Return type `numpy.ndarray` or `scipy.sparse.spmatrix`

n

`int` – The dimension of the squared decomposed matrix.

p

`numpy.ndarray` – The permutation vector. $A[p[:, np.newaxis], p[np.newaxis, :]]$ is the matrix A permuted by the permutation of the decomposition

p_inverse

`numpy.ndarray` – The permutation vector that undoes the permutation.

permute_matrix (*A*)

Permute a matrix by the permutation of the decomposition.

Parameters **A** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – The matrix that should be permuted.

Returns The matrix A permuted by the permutation of the decomposition.

Return type `numpy.ndarray` or `scipy.sparse.spmatrix`

save (*filename*)

Saves this decomposition.

Parameters **filename** (`str`) – Where this decomposition should be saved.

solve (*b*)

Solves the equation $A x = b$ regarding x , where A is the composed matrix represented by this decomposition.

Parameters **b** (`numpy.ndarray` or `scipy.sparse.spmatrix`) – Right-hand side vector or matrix in equation $A x = b$. It must hold `self.n == b.shape[0]`.

Returns An x so that $A x = b$. The shape of x matches the shape of b .

Return type `numpy.ndarray` or `scipy.sparse.spmatrix`

Raises `matrix.errors.DecompositionSingularError` – If this is a decomposition representing a singular matrix.

type_str = 'base'

`str` – The type of this decomposition represented as string.

unpermute_matrix(*A*)

Unpermute a matrix permuted by the permutation of the decomposition.

Parameters *A* (`numpy.ndarray` or `scipy.sparse.spmatrix`) – The matrix that should be unpermuted.

Returns The matrix *A* unpermuted by the permutation of the decomposition.

Return type `numpy.ndarray` or `scipy.sparse.spmatrix`

4.3 Errors

This is an overview about the exceptions that could arise in this package. They are available in `matrix.errors`:

If a matrix should be decomposed with `matrix.decompose` and the desired decomposition is not computable, the following exceptions can be raised:

4.3.1 NoDecompositionPossibleError

class `matrix.errors.NoDecompositionPossibleError`(*base*, *desired_type*)

Bases: `matrix.errors.BaseError`

It is to possible to calculate a desired matrix decomposition.

4.3.2 NoDecompositionPossibleWithProblematicSubdecompositionError

class `matrix.errors.NoDecompositionPossibleWithProblematicSubdecompositionError`(*base*, *desired_type*, *problematic_leading_principal_subdecomposition*)

Bases: `matrix.errors.NoDecompositionPossibleError`

It is not possible to calculate a desired matrix decomposition. Only a subdecomposition could be calculated

4.3.3 NoDecompositionPossibleTooManyEntriesError

class `matrix.errors.NoDecompositionPossibleTooManyEntriesError`(*matrix*, *desired_type*)

Bases: `matrix.errors.NoDecompositionPossibleError`

The matrix decomposition is not possible for this matrix because it would have too many entries.

4.3.4 NoDecompositionConversionImplementedError

class `matrix.errors.NoDecompositionConversionImplementedError` (*decomposition, desired_type*)

Bases: `matrix.errors.NoDecompositionPossibleError`

A decomposition conversion is not implemented for this type.

If a matrix has an invalid characteristic, the following exceptions can occur:

4.3.5 MatrixNotSquareError

class `matrix.errors.MatrixNotSquareError` (*matrix*)

Bases: `matrix.errors.MatrixError`

A matrix is not a square matrix although this is required.

4.3.6 MatrixNotFiniteError

class `matrix.errors.MatrixNotFiniteError` (*matrix*)

Bases: `matrix.errors.MatrixError`

A matrix has non-finite entries although a finite matrix is required.

4.3.7 MatrixSingularError

class `matrix.errors.MatrixSingularError` (*matrix*)

Bases: `matrix.errors.MatrixError`

A matrix is singular although an invertible matrix is required.

4.3.8 MatrixNotHermitianError

class `matrix.errors.MatrixNotHermitianError` (*matrix, i=None, j=None*)

Bases: `matrix.errors.MatrixError`

A matrix is not Hermitian although a Hermitian matrix is required.

4.3.9 MatrixComplexDiagonalValueError

class `matrix.errors.MatrixComplexDiagonalValueError` (*matrix, i=None*)

Bases: `matrix.errors.MatrixNotHermitianError`

A matrix has complex diagonal values although real diagonal values are required.

All these exceptions are based on the following exception:

4.3.10 MatrixError

class `matrix.errors.MatrixError` (*matrix, message=None*)

Bases: `matrix.errors.BaseError`

An exception related to a matrix.

If the matrix represented by a decomposition has an invalid characteristic, the following exceptions can occur:

4.3.11 DecompositionNotFiniteError

```
class matrix.errors.DecompositionNotFiniteError(decomposition)  
    Bases: matrix.errors.DecompositionError
```

A decomposition of a matrix has non-finite entries although a finite matrix is required.

4.3.12 DecompositionSingularError

```
class matrix.errors.DecompositionSingularError(decomposition)  
    Bases: matrix.errors.DecompositionError
```

A decomposition represents a singular matrix although a non-singular matrix is required.

If a decomposition should be loaded from a file which is not a valid decomposition file, the following exception is raised:

4.3.13 DecompositionInvalidFile

```
class matrix.errors.DecompositionInvalidFile(filename)  
    Bases: matrix.errors.DecompositionError, OSError
```

A decomposition indicated that a decomposition should be loaded from an invalid file.

If a decomposition should be loaded from a file which contains a type which does not fit to the type of the decomposition where it should be loaded into, the following exception is raised:

4.3.14 DecompositionInvalidDecompositionTypeFile

```
class matrix.errors.DecompositionInvalidDecompositionTypeFile(filename,  
                                                                type_file,  
                                                                type_needed)  
    Bases: matrix.errors.DecompositionInvalidFile
```

A decomposition indicated that a decomposition should be loaded from an file in which another decomposition type is stored.

All these exceptions are based on the following exception:

4.3.15 DecompositionError

```
class matrix.errors.DecompositionError(decomposition, message=None)  
    Bases: matrix.errors.BaseError
```

An exception related to a decomposition.

The following exception is the base exception from which all other exceptions in this package are derived:

4.3.16 BaseError

```
class matrix.errors.BaseError(message)  
    Bases: Exception
```

This is the base exception for all exceptions in this package.

4.4 Changelog

4.4.1 0.8

- Approximation functions are replaced by more sophisticated approximation functions.
- Explicit function for approximating a matrix by a positive (semi)definite matrix is added.
- Universal save and load functions are added.
- Decompositions obtain `is_equal` and `is_almost_equal` methods.
- Functions to multiply the matrix represented by a decomposition or its inverse with a matrix or a vector are added.
- Allow to directly pass a permutation vector to approximate and decompose methods.

4.4.2 0.7

- Linear systems associated to matrices or decompositions can now be solved.
- Invertibility of matrices and decompositions can now be examined.
- Decompositions can now be examined to see if they contain only finite values.

4.4.3 0.6

- Decompositions are now saveable and loadable.

4.4.4 0.5

- Matrices can now be approximated by decompositions.

4.4.5 0.4

- Positive definiteness and positive semi-definiteness of matrices and decompositions can now be examined.

4.4.6 0.3

- Dense and sparse matrices are now decomposable into several types (LL, LDL, LDL compressed).

4.4.7 0.2

- Decompositons are now convertible to other decompositon types.
- Decompositions are now comparable.

4.4.8 0.1

- Several decompositions types are added (LL, LDL, LDL compressed).
- Several permutation capabilities added.

CHAPTER 5

Indices and tables

- `genindex`
- `search`
